Module 5

Vectors in 2-Space and 3-Space II

1

Learning Objectives

Upon completing this module, you should be able to:

1. Determine the cross product of a vector in \mathfrak{R}^3 .
2. Determine a scalar triple product of three vectors in \mathfrak{R}^3 .
3. Find the area of a parallelogram and the volume of a parallelepiped in \mathfrak{R}^3 .
4. Find the sine of the angle between two vectors in \mathfrak{R}^3 .
5. Find the equation of a plane in \mathfrak{R}^3 .
6. Find the parametric equations of a line in \mathfrak{R}^3 .
7. Find the distance between a point and a plane in \mathfrak{R}^3 .

3

Quick Review: The Norm of a Vector in \mathcal{R}^3

- The **norm** of a vector \mathbf{u} , $\|\vec{u}\| = \|\mathbf{u}\|$, is the length or the **magnitude** of the vector \mathbf{u} .
- If $\mathbf{u} = (u_1, u_2, u_3) = (-1, 4, -8)$, then the norm of the vector \mathbf{u} is
$$\|\vec{u}\| = \sqrt{u_1^2 + u_2^2 + u_3^2} = \sqrt{(-1)^2 + 4^2 + (-8)^2} = 9$$
- This is just the distance of the terminal point to the origin for \mathbf{u} in standard position.

Note: If \mathbf{u} is any nonzero vector, then $\frac{\mathbf{u}}{\|\vec{u}\|}$ is a unit vector. A unit vector is a vector of norm 1.

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

4

The Cross Product of Two Vectors in \mathfrak{R}^3

- The **cross product** of two vectors $\mathbf{u} = (u_1, u_2, u_3)$ and $\mathbf{v} = (v_1, v_2, v_3)$, $\mathbf{u} \times \mathbf{v}$, in \mathfrak{R}^3 is a vector in \mathfrak{R}^3 .
- The direction of the **cross product**, $\mathbf{u} \times \mathbf{v}$, is always perpendicular to the two vectors \mathbf{u} and \mathbf{v} and the plane determined by \mathbf{u} and \mathbf{v} that is parallel to both \mathbf{u} and \mathbf{v} .
- The norm of the cross product is $\|\vec{u} \times \vec{v}\| = \|\vec{u}\| \|\vec{v}\| \sin(\theta)$.

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

5

The Cross Product of Two Vectors in \mathfrak{R}^3 (Cont.)

The **cross product** can be represented symbolically in the form of a 3 x 3 determinant:

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix} = \begin{vmatrix} u_2 & u_3 \\ v_2 & v_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} u_1 & u_3 \\ v_1 & v_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} u_1 & u_2 \\ v_1 & v_2 \end{vmatrix} \mathbf{k}$$

$$= \left(\begin{vmatrix} u_2 & u_3 \\ v_2 & v_3 \end{vmatrix}, - \begin{vmatrix} u_1 & u_3 \\ v_1 & v_3 \end{vmatrix}, \begin{vmatrix} u_1 & u_2 \\ v_1 & v_2 \end{vmatrix} \right)$$

where $\mathbf{i} = (1,0,0)$, $\mathbf{j} = (0,1,0)$, $\mathbf{k} = (0,0,1)$ are **standard unit vectors**.

Note: Every vector in \mathfrak{R}^3 is expressible in terms of the standard unit vectors.

$$\mathbf{v} = (v_1, v_2, v_3) = v_1(1,0,0) + v_2(0,1,0) + v_3(0,0,1) = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$$

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

6

The Cross Product of Two Vectors in \mathbb{R}^3 (Cont.)

Example: Find the **cross product** of $\mathbf{u} = (0,2,-3)$ and $\mathbf{v} = (2,6,7)$.

Solution:

The **cross product** can be obtained as follows:

$$\begin{aligned}\mathbf{u} \times \mathbf{v} &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & 2 & -3 \\ 2 & 6 & 7 \end{vmatrix} = \begin{vmatrix} 2 & -3 \\ 6 & 7 \end{vmatrix} \mathbf{i} - \begin{vmatrix} 0 & -3 \\ 2 & 7 \end{vmatrix} \mathbf{j} + \begin{vmatrix} 0 & 2 \\ 2 & 6 \end{vmatrix} \mathbf{k} \\ &= 32\mathbf{i} - 6\mathbf{j} - 4\mathbf{k} \\ &= (32, -6, -4)\end{aligned}$$

To check the orthogonality:

$$\mathbf{u} \cdot (\mathbf{u} \times \mathbf{v}) = (0, 2, -3) \cdot (32, -6, -4) = (0)(32) + (2)(-6) + (-3)(-4) = 0$$

$$\mathbf{v} \cdot (\mathbf{u} \times \mathbf{v}) = (2, 6, 7) \cdot (32, -6, -4) = (2)(32) + (6)(-6) + (7)(-4) = 0$$

Rev.F09

7

How to Find a Scalar Triple Product?

First of all, what is a scalar triple product?

A **scalar triple product** of three vectors is a combination of a **dot product** with a cross product as follows:

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}) = \mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})$$

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

8

How to Find a Scalar Triple Product? (Cont.)

Example: Calculate a scalar triple product of $\mathbf{u} = (0, 2, -3)$, $\mathbf{v} = (2, 6, 7)$, and $\mathbf{w} = (-1, 0, 3)$.

Solution:

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = \mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}) = \mathbf{w} \cdot (\mathbf{u} \times \mathbf{v})$$

From the previous slide, $\mathbf{u} \times \mathbf{v} = (32, -6, -4)$. Similarly, we can obtain $\mathbf{u} \times \mathbf{w} = (6, 3, 2)$ and $\mathbf{v} \times \mathbf{w} = (18, -13, 6)$. Try it now. All three should give the same outcome or result.

$$\mathbf{w} \cdot (\mathbf{u} \times \mathbf{v}) = (-1, 0, 3) \cdot (32, -6, -4) = (-1)(32) + (0)(-6) + (3)(-4) = -44$$

$$\mathbf{v} \cdot (\mathbf{w} \times \mathbf{u}) = (2, 6, 7) \cdot (-6, -3, -2) = (2)(6) + (6)(3) + (7)(2) = -44$$

$$\mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}) = (0, 2, -3) \cdot (18, -13, 6) = (0)(18) + (2)(-13) + (-3)(6) = -44$$

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

9

How to Find the Area of a Parallelogram?

The area of the parallelogram, A , determined by $\mathbf{u} = (u_1, u_2, u_3)$ and $\mathbf{v} = (v_1, v_2, v_3)$ in \mathfrak{R}^3 is as follows:

$$A = \|\vec{u} \times \vec{v}\|$$

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

10

How to Find the Area of a Parallelogram? (Cont.)

Example: Find the area of the parallelogram of $\mathbf{u} = (1, -1, 2)$ and $\mathbf{v} = (0, 3, 1)$.

Solution:

$$\begin{aligned}\vec{u} \times \vec{v} &= \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ 1 & -1 & 2 \\ 0 & 3 & 1 \end{vmatrix} = \begin{vmatrix} -1 & 2 \\ 3 & 1 \end{vmatrix} \vec{i} - \begin{vmatrix} 1 & 2 \\ 0 & 1 \end{vmatrix} \vec{j} + \begin{vmatrix} 1 & -1 \\ 0 & 3 \end{vmatrix} \vec{k} \\ &= -7\vec{i} - \vec{j} + 3\vec{k} = (-7, -1, 3)\end{aligned}$$

Thus, the area of the parallelogram is

$$A = \|\vec{u} \times \vec{v}\| = \sqrt{(-7)^2 + (-1)^2 + (3)^2} = \sqrt{59}$$

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

11

How to Find the Volume of a Parallelepiped?

The volume of a parallelepiped, V , determined by $\mathbf{u} = (u_1, u_2, u_3)$, $\mathbf{v} = (v_1, v_2, v_3)$, and $\mathbf{w} = (w_1, w_2, w_3)$ in \mathfrak{R}^3 is as follows:

$$V = |\vec{u} \cdot (\vec{v} \times \vec{w})|$$

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

12

How to Find the Volume of a Parallelepiped? (Cont.)

Example: Find the volume of the parallelepiped of $\mathbf{u} = (-1, -2, 4)$, $\mathbf{v} = (4, 5, 1)$, and $\mathbf{w} = (1, 2, 4)$.

Solution:

$$\vec{u} \cdot (\vec{v} \times \vec{w}) = \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} = \begin{vmatrix} -1 & 2 & 4 \\ 4 & 5 & 1 \\ 1 & 2 & 4 \end{vmatrix}$$

$$= -1 \begin{vmatrix} 5 & 1 \\ 2 & 4 \end{vmatrix} - 2 \begin{vmatrix} 4 & 1 \\ 1 & 4 \end{vmatrix} + 4 \begin{vmatrix} 4 & 5 \\ 1 & 2 \end{vmatrix}$$

$$= -1(18) - 2(15) + 4(3) = -36$$

Note: If \mathbf{u} , \mathbf{v} , and \mathbf{w} have the same initial point, then they lie in the same plane and the volume of the parallelepiped is zero.

Thus, the volume of the parallelepiped is

$$V = |\vec{u} \cdot (\vec{v} \times \vec{w})| = |-36| = 36$$

Rev.F09

Click link to download other modules.

13

How to Find the Sine of the Angle Between Two Vectors?

Example: Use the cross product to find the sine of the angle between the vectors $\mathbf{u} = (2, 3, -6)$ and $\mathbf{v} = (2, 3, 6)$.

Solution:

We can use equation (6) derived from the Lagrange's identity.

$$\|\vec{u} \times \vec{v}\| = \|\vec{u}\| \|\vec{v}\| \sin(\theta)$$

$$\sin(\theta) = \frac{\|\vec{u} \times \vec{v}\|}{\|\vec{u}\| \|\vec{v}\|}$$

Note 1: Lagrange's identity: $\|\mathbf{u} \times \mathbf{v}\|^2 = \|\mathbf{u}\|^2 \|\mathbf{v}\|^2 - (\mathbf{u} \cdot \mathbf{v})^2$.

Note 2: If θ denotes the angle between two nonzero vectors \mathbf{u} and \mathbf{v} , then $\mathbf{u} \cdot \mathbf{v} = \|\mathbf{u}\| \|\mathbf{v}\| \cos(\theta)$. (From previous module.)

Click link to download other modules.

14

How to Find the Sine of the Angle Between Two Vectors? (Cont.)

Step 1: Find the cross product of \mathbf{u} and \mathbf{v} .

$$\begin{aligned}\vec{u} \times \vec{v} &= \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ 2 & 3 & -6 \\ 2 & 3 & 6 \end{vmatrix} = \begin{vmatrix} 3 & -6 \\ 3 & 6 \end{vmatrix} \vec{i} - \begin{vmatrix} 2 & -6 \\ 2 & 6 \end{vmatrix} \vec{j} + \begin{vmatrix} 2 & 3 \\ 2 & 3 \end{vmatrix} \vec{k} \\ &= 36\vec{i} - 24\vec{j} + 0\vec{k} = (36, -24, 0)\end{aligned}$$

Step 2: Find the norm of the cross product of \mathbf{u} and \mathbf{v} .

$$\|\vec{u} \times \vec{v}\| = \sqrt{(36)^2 + (-24)^2 + (0)^2} = \sqrt{1872}$$

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

15

How to Find the Sine of the Angle Between Two Vectors? (Cont.)

Step 3: Find $\sin(\theta)$.

$$\begin{aligned}\sin(\theta) &= \frac{\|\vec{u} \times \vec{v}\|}{\|\vec{u}\|\|\vec{v}\|} \\ &= \frac{\sqrt{1872}}{\sqrt{(2)^2 + (3)^2 + (-6)^2} \sqrt{(2)^2 + (3)^2 + (6)^2}} \\ &= \frac{\sqrt{1872}}{\sqrt{49}\sqrt{49}} = \frac{\sqrt{1872}}{49}\end{aligned}$$

16

Some Important Relationships Involving Cross Products and Dot Products

If \mathbf{u} , \mathbf{v} , and \mathbf{w} are vectors in \mathfrak{R}^3 , then the following hold:

- a) $\mathbf{u} \cdot (\mathbf{u} \times \mathbf{v}) = \mathbf{0}$ ($\mathbf{u} \times \mathbf{v}$ is orthogonal to \mathbf{u})
- b) $\mathbf{v} \cdot (\mathbf{u} \times \mathbf{v}) = \mathbf{0}$ ($\mathbf{u} \times \mathbf{v}$ is orthogonal to \mathbf{v})
- c) $\|\mathbf{u} \times \mathbf{v}\|^2 = \|\mathbf{u}\|^2 \|\mathbf{v}\|^2 - (\mathbf{u} \cdot \mathbf{v})^2$ (Lagrange's Identity)

Rev.F09

Click link to download other modules.

17

Some Important Properties of Cross Products

If \mathbf{u} , \mathbf{v} , and \mathbf{w} are vectors in \mathfrak{R}^3 and s is a scalar, then the following hold: (See Theorem 3.4.2)

- a) $\mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u})$
- b) $\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = (\mathbf{u} \times \mathbf{v}) + (\mathbf{u} \times \mathbf{w})$
- c) $(\mathbf{u} + \mathbf{v}) \times \mathbf{w} = (\mathbf{u} \times \mathbf{w}) + (\mathbf{v} \times \mathbf{w})$
- d) $s(\mathbf{u} \times \mathbf{v}) = (s\mathbf{u}) \times \mathbf{v} = \mathbf{u} \times (s\mathbf{v})$
- e) $\mathbf{u} \times \mathbf{0} = \mathbf{0} \times \mathbf{u} = \mathbf{0}$
- f) $\mathbf{u} \times \mathbf{u} = \mathbf{0}$

Quick Review: Finding the Distance Between Two Points in \mathfrak{R}^3 ?

If $A(x_1, y_1, z_1)$ and $B(x_2, y_2, z_2)$ are two points in \mathfrak{R}^3 , then the **distance** between the two points is the length, the magnitude, and the **norm of the vector** \overrightarrow{AB} .

$$d = \|\overrightarrow{AB}\| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

The Point-Normal Form and the Standard Form of the Equation of a Plane

To find the equation of the plane passing through the point $P_0(x_0, y_0, z_0)$ and having a **nonzero vector** $\mathbf{n} = (a, b, c)$ that is **perpendicular (normal) to the plane**, we proceed as follows:

- Let $P(x, y, z)$ be any point in the plane but not equal to P_0 .
- Then the vector $\overrightarrow{P_0P} = (x - x_0, y - y_0, z - z_0)$ is in the plane and parallel to the plane and orthogonal to \mathbf{n} .

The Point-Normal Form and the Standard Form of the Equation of a Plane (Cont.)

$$\begin{aligned}\text{Thus, } \vec{n} \cdot \overrightarrow{P_0P} &= a(x - x_0) + b(y - y_0) + c(z - z_0) = 0 \\ ax + by + cz &= ax_0 + by_0 + cz_0 = d \\ ax + by + cz &= d\end{aligned}$$

This is the standard linear equation of a plane in \mathfrak{R}^3 .

Note if $c = 0$, we have the standard linear equation of a line in \mathfrak{R}^2 .

The top equation is the so called **point-normal form** of the equation of a plane.

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

21

The Point-Normal Form and the Standard Form of the Equation of a Plane (Cont.)

Example: Find the equation of the plane passing through the point $P_0(-5, 3, -2)$ and having a **normal vector** $\mathbf{n} = (-7, 2, 3)$.

Solution:

$$\begin{aligned}\vec{n} \cdot \overrightarrow{P_0P} &= 0 \\ -7(x - (-5)) + 2(y - 3) + 3(z - (-2)) &= 0 \\ -7(x + 5) + 2(y - 3) + 3(z + 2) &= 0 \\ -7x + 2y + 3z &= 35\end{aligned}$$

We obtain the point-normal form of the equation of the plane and the standard form of the equation of the plane. Is P_0 in the plane? Does P_0 satisfy the two equations?

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

22

How to Find an Equation of a Plane Passing Through the Given Points in \mathfrak{R}^3 ?

$P(-4,-1,-1)$, $Q(-2,0,1)$ and $R(-1,-2,-3)$ are in \mathfrak{R}^3 , find an equation of the plane passing through these three points.

Solution:

Step 1: Find the vectors \overrightarrow{PQ} and \overrightarrow{PR}
 $\overrightarrow{PQ} = (2,1,2)$ $\overrightarrow{PR} = (3,-1,-2)$

Step 2: Find the cross product

$$\overrightarrow{PQ} \times \overrightarrow{PR} = \begin{vmatrix} \vec{i} & \vec{j} & \vec{k} \\ 2 & 1 & 2 \\ 3 & -1 & -2 \end{vmatrix} = \begin{vmatrix} 1 & 2 \\ -1 & -2 \end{vmatrix} \vec{i} - \begin{vmatrix} 2 & 2 \\ 3 & -2 \end{vmatrix} \vec{j} + \begin{vmatrix} 2 & 1 \\ 3 & -1 \end{vmatrix} \vec{k}$$

$$= 0\vec{i} + 10\vec{j} - 5\vec{k} = (0,10,-5) = \vec{n}$$

Recall: The direction of the cross product, $\mathbf{u} \times \mathbf{v}$, is always perpendicular to the two vectors \mathbf{u} and \mathbf{v} .

Rev.F09

<http://faculty.valenciacc.edu/ashaw/>
Click link to download other modules.

23

How to Find an Equation of a Plane Passing Through the Given Points in \mathfrak{R}^3 ? (Cont.)

Step 3: Find the equation of the plane passing through the point $P(-4,-1,-1)$ with the **normal vector**

$\mathbf{n} = (0, 10, -5)$.

$$0(x+4) + 10(y+1) + (-5)(z+1) = 0$$

$$10y + 10 - 5z - 5 = 0$$

$$10y - 5z = -5$$

$$2y - z = -1$$

Try this with point Q or point R .

24

How to Find the Parametric Equations of a Line Passing Through the Given Points?

Example: Find the parametric equations for the line through: $P_0(5,-2,4)$ and $P_1(7,2,-4)$.

Step 1: Find the vector $\vec{v} = (a,b,c) = \overrightarrow{P_0P_1}$

$$\overrightarrow{P_0P_1} = (2,4,-8)$$

Step 2: By using this vector and the point $P_0(5,-2,4)$, we can get the **parametric equations** as follows:

$$(x-5, y+2, z-4) = t(2,4,-8), t \in (-\infty, \infty)$$

or $x = 5 + 2t, y = -2 + 4t, z = 4 - 8t, t \in (-\infty, \infty)$

which are the component equations for $\vec{r} = \vec{r}_0 + t\vec{v}$
the vector equation form.

Note: The parametric equations for the line passing through the point $P(x_0, y_0, z_0)$ and parallel to a nonzero vector $\mathbf{v}=(a,b,c)$ are given by $(x-x_0, y-y_0, z-z_0) = t\mathbf{v}$, or in vector form:

$$\vec{r} - \vec{r}_0 = t\vec{v}$$

$$\vec{r} = \vec{r}_0 + t\vec{v}$$

25

How to Find the Distance Between a Point and a Plane?

Example

Find the distance D from the point $(-3,1,2)$ to the plane $2x+3y-6z+4=0$.

Solution:

We can use the distance formula in Equation (9)

$$D = \frac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}}$$

to find the distance D . In our problem, $x_0=-3, y_0=1, z_0=2, a=2, b=3, c=-6,$ and $d=4$.

$$D = \frac{|ax_0 + by_0 + cz_0 + d|}{\sqrt{a^2 + b^2 + c^2}} = \frac{|(2)(-3) + (3)(1) + (-6)(2) + 4|}{\sqrt{2^2 + 3^2 + (-6)^2}} = \frac{|-11|}{\sqrt{49}} = \frac{11}{7}$$

Rev.F09

26

What have we learned?

We have learned to:

1. Determine the cross product of a vector in \mathbb{R}^3 .
2. Determine a scalar triple product of three vectors in \mathbb{R}^3 .
3. Find the area of a parallelogram and the volume of a parallelepiped in \mathbb{R}^3 .
4. Find the sine of the angle between two vectors in \mathbb{R}^3 .
5. Find the equation of a plane in \mathbb{R}^3 .
6. Find the parametric equations of a line in \mathbb{R}^3 .
7. Find the distance between a point and a plane in \mathbb{R}^3 .
